

Update June 11, 2024

The Crypto Portfolio Tracker has undergone some changes. The Help document will therefore be 'overhauled' and will now also be available online. This makes it possible to regularly update the Help document without having to update the app. The current version of the app already contains several changes and additions that are not yet listed in this Help document. This gives me some time to create a neat document and you can already use some new features.

Check regularly for changes to this Help document via the 'Help' option in the navigation menu.

How to start

Assuming that you already have some crypto coins in your 'real life' portfolio, we start with adding these coins to the Coin Library. This because we only can work with the coins that are known in the library. So, click on 'Coin Library' in the navigation menu on the left side and start adding coins using the 'Add a coin to the Library' button.

The next thing to do is providing the app with the location(s) of where your crypto is stored. Do you keep them on a Ledger or at an exchange like Bybit or Bitvavo, or at multiple locations which is what I call 'GCCP' meaning 'Good Crypto Custody Practice'. These locations are called Accounts in this app. So, click on 'Accounts' in the navigation menu and add the accounts that you need using the 'Add a new Account' button.

Your total portfolio is called Assets in this app and you get an overview of this by selecting 'Assets' in the navigation menu. If you go to assets, the list will be empty at this moment. Your asset positions are build up by entering transactions. The easiest thing to do now is getting the current position of a coin in your portfolio at a certain account and create a ' deposit' transaction for this.

Example:

You now have 2.3 ETH on your Ledger and 0.5 ETH at Bybit Unified Trading Account. You

have bought these Ethereum in the past at a price of 1250 USDT per ETH.

Add Transaction

Transaction Type

☒ Deposit ☐ Withdraw ☐ Transfer ☐ Convert ☐ Buy ☐ Sell

A Deposit is a transaction where 'new' crypto flows into your portfolio. The source is a fiat bank account and will be marked as 'External'

Coin

ETH

Deposit Account

Bybit Unified Trading Account

Qty **Price**

2.3 1250

Date **Time**

April 8, 2024 14:40

Notes

Initial deposit

Accept Transaction Cancel

- 1 - In the Assets View, click on the 'Add a new Transaction' button.
- 2 - Select 'Deposit' as the transaction type.
- 3 - In the 'Coin' box, select 'ETH'
- 4 - In the 'Account' box, select 'Ledger'
- 5 - In the 'Qty' box, enter the amount 2.3
- 6 - In the 'Price' box the actual price of ETH is shown. Click here to enter the price for 1 ETH at the time of purchase which we said was 1250 USDT. This is to keep track of the 'Average Cost' for this coin.
- 7 - You can leave the date and time fields at the current date or change them to the (approx.) time of purchase.
- 8 - In the 'Note' field you can make a note like 'Initial deposit' or something like that. A note is not mandatory.
- 9 - The entry fields of this dialog are constantly validated and when all are valid the 'Accept Transaction' button will be enabled. Click this button and your first asset will be visible in the assets list.

Repeat above steps for ETH in your Bybit Unified Trading Account. After this, the Assets

list will show you that you have 2.8 ETH in your portfolio. When you click on the 'ETH' item in the list, you will see which accounts are holding your ETH.

Do this for all your assets, including USDT and eventually USDC.

When done, you will have all your crypto's in one view. And with just a click you know where they are and how much you have at a certain Account.

By the way, when you click in the Accounts view on an account, you will see all coins holding by that account.

Have fun! And see some more tips and info below.

Tips

Label a coin

Add a note to a coin for extra information. With this you can easily identify a coin as a 'Crypto Parel', for example. The note can be added in the Coin Library.

Click on Asset

Click on an account in the Accounts overview to get detailed information on assets being hold in that account. Click again on the account to get back to the overall Accounts view.

Combine a 'Convert', 'Buy' or 'Sell' with a transfer

The screenshot shows a transaction form with two main sections: 'From Account' and 'To Account'. Both sections have a dropdown menu currently displaying 'Bybit Funding Account'. A double-headed arrow icon is positioned between the two dropdowns, indicating a link between the accounts. Below the dropdowns, there are partially visible labels 'Qty' and 'Price'.

When creating a transaction, by default the 'link-accounts' option is enabled. Meaning that 'From' and 'To' are similar. Are you going to move the obtained currency to another account then the transaction can include a 'Transfer' as well. To do so, disable the 'link-accounts' button between both account fields. This enables the selection of the 'To Account'

Add a Fee to the transaction separately, or ignore it.

The screenshot shows a fee selection form with two input fields. The first field is labeled 'Fee (gas)' and contains the value '0'. The second field is labeled 'Coin' and contains the value 'ETH'.

For 'transfer', 'Convert', 'Buy' and 'Sell' transactions it is possible to add also the Fee involved with it. You can also take care of it by entering the numbers for Qty included with the fee and ignore the Fee fields. It's up to you.

Choose your preferred Number Format

At 'Settings' you can choose how you want numbers being displayed. A period (.) for decimals or a comma (,)

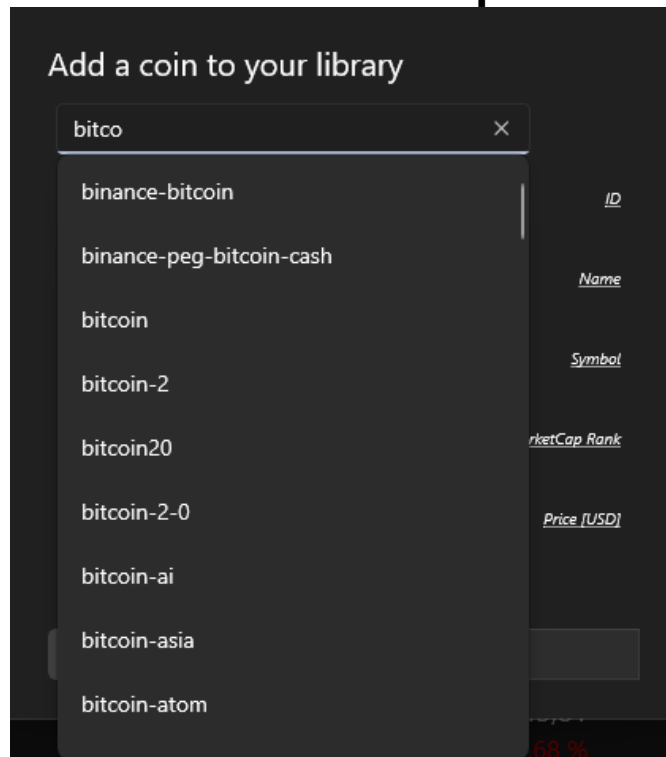

Miscellaneous

Loading a coin takes a while

Coin data is retrieved from CoinGecko using their public API. If you do a couple of coin requests after another it can happen that "Too Many" requests is returned. CoinGecko has limited the amount of requests to their public API. The CryptoPortfolioTracker software is automatically retrying a couple of times, with a 30 second delay in between. So be patient if you see the progress ring.

Coin search based on Api-ID

To search a coin, you have to enter the name of it instead of the symbol. The list presented are API-ID's which are unique. The name of a coin is not always unique. For example searching for bitcoin needs to be done by typing 'bitcoin' instead of 'BTC'
